Experiment 6: Session Tracking using HttpSession

AIM:

Todemonstrate session tracking using HttpSession by implementing a simple login system where user credentials are validated and session data is maintained across pages.

PROCEDURE:

1. Create a Dynamic Web Project in Eclipse.
2. Create a login form with username and password fields.
3. Develop a Login Servlet to validate credentials.
4. Use HttpSession to create and manage user sessions.
5. Store user data using session.setAttribute().
6. Create a protected page (dashboard) to display user data.
7. Implement logout functionality using session.invalidate().
8. Run the application on Apache Tomcat and test session behavior.

CODE:

HTML (Login Form):

```
<form action="LoginServlet" method="post">
Username: <input type="text" name="username">
Password: <input type="password" name="password">
<input type="submit" value="Login">
</form>
```

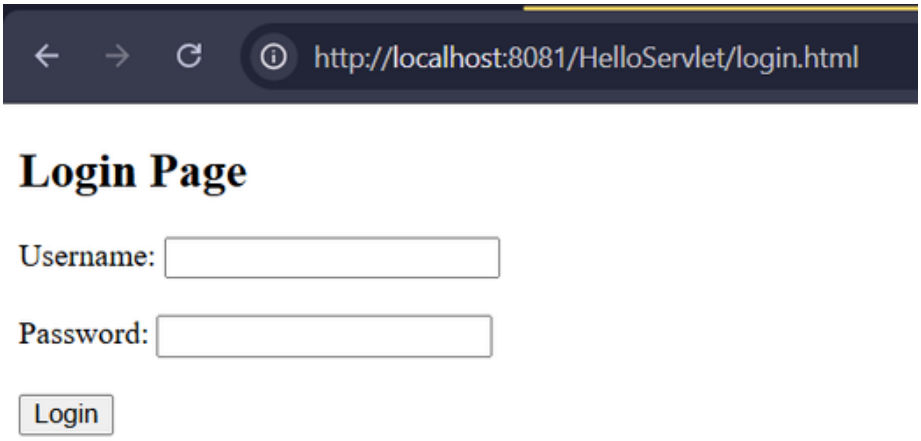
Servlet (Session Handling):

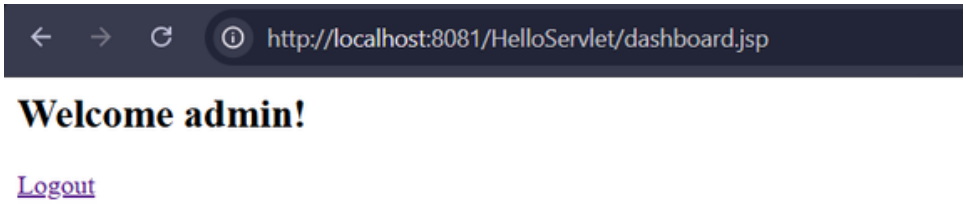
```
HttpSession session = request.getSession();
session.setAttribute("user", username);
```

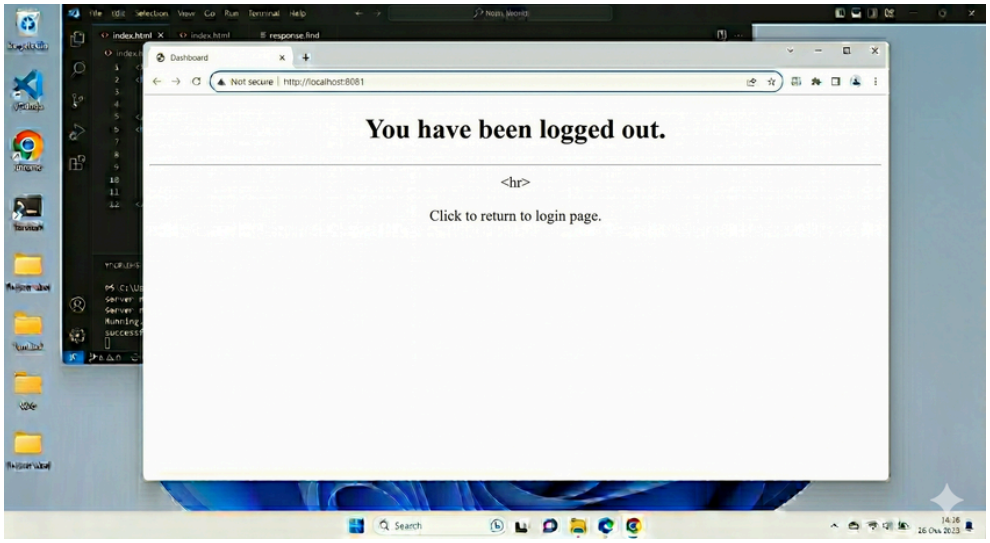
Logout:

```
session.invalidate();
```

OUTPUT:







RESULT:

Sessiontracking using HttpSession is successfully implemented, allowing user login, session maintenance, and logout functionality.
